## APPENDIX B

### WATER QUALITY AND TEMPERATURE DATA

Surface water quality data is available for the following water resources in the project area:

- Mendota Wildlife Area (Table B-1);
- Mendota Pool (Table B-2);
- San Joaquin River below Mendota Dam (Table B-3);
- Delta Mendota Canal (Table B-4); and
- California Aqueduct (Table B-5).

Original water quality data and source tables, when available, are presented as Attachments to Appendix B.

## *San Joaquin River Immediately Below Mendota Dam*

The primary area of concern for water quality downstream from Mendota Dam begins in the reach downstream from Sack Dam, where virtually all of the flow consists of agricultural drainage (California Regional Water Quality Control Board [CRWQCB] 1988). Constituents of primary concern, in addition to selenium, include TDS, and boron.

**Table B-3**

#### *Delta Mendota Canal*

The Delta Mendota Canal is a potential source of Level 4 water supplies for the MWA. Table B-4 presents Delta Mendota Canal water quality data collected monthly from January 1990 through December 1999.

## California Aqueduct

The California Aqueduct via Westlands Water District Laterals is a potential source of Level 4 water supplies for MWA. Table B-5 presents California Aqueduct water quality data collected monthly from January 1995 through March 2000. Water quality in the Westlands Water District Laterals is similar to the source waters (California Aqueduct) but growers can pump groundwater into the canals as long as the combined water mixture meets applicable water quality standards (Bettner 2000). Additionally, Westlands Water District Laterals could possibly receive irrigation drainage. Due to possible mixing of groundwater and irrigation drainage with California Aqueduct water, water quality in the Westlands Water District Laterals is likely to vary significantly from the data in Table B-5.

Temperature regulation for fish in the San Joaquin River is an additional water quality concern in the project area. Two of the sites, the DMC at Mendota Pool and the San Joaquin River near Mendota, have

more than 30 years of record. However, the data represent samples collected less than once per month over that period and, thus, represent sparse coverage within the period.

**Table B-6**  
**Summary of Temperature Data (degrees Fahrenheit) in the Upper San Joaquin River Basin**

	06/27/84	06/14/88	38	57	60	66	70	78	80	29

The median temperature at most of the sites shown in Table B-6 is in the low- to mid-60s. With the exception of the California Aqueduct, all stations have maximum temperatures that range from near 80 degrees Fahrenheit (°F) to the mid-80s; the maximum temperature of the aqueduct is 74 °F.

#### *Site Groundwater Quality*

Several wells were drilled or sampled on the MWA in the early 1990s. Selected data from those wells are shown in Table B-7. The data are limited to only a few of the wells. As can be seen in Table B-7, most of the well waters are high in total dissolved solids (TDS); most of the TDS data are estimated from the conductivity data shown. The minimum TDS shown in Table B-7, however, is a measured value.

In addition to TDS, boron is very high in the unconfined groundwater beneath the MWA. The State of California's agricultural water quality objective for boron is 0.8 milligrams per liter (mg/L) or 800 µg/L for use on sensitive crops. The concentrations in unconfined aquifer would be potentially harmful to most plants if the water were to be used for irrigation.

Selenium and molybdenum were analyzed in the majority of well samples shown in Table B-7. All of the selenium and molybdenum samples were below analytical detection (or reporting) limits. However, those limits were very high in many instances, particularly in the April 1992 samples. Since selenium downstream from MWA has been absent at even lower reporting limits than those shown in Table B-7, harmful levels of selenium are probably not present (CRWQCB 1988).
